

The Bantam Weight Championship

Years ago, I was sitting in my office in a very old dilapidated building when I noticed a yellow-jacket had flown into a spider's web. I decided to watch the coming events expecting to see a good fight. What I witnessed was much more enlightening than just a good fight! But, before I tell you what I witnessed, let me get my story finished.

Also years ago, an NPR "Earth & Sky" presentation on WETA Radio was another slick "bait and switch" presentation for evolution. Each individual sentence was true (or close), but the implications and evolutionary suggestions were totally false.

The subject was "aposematic coloring." This is a fancy word to tell the listener that the speaker knows more than the listener, so just listen and believe everything you hear. (This is often the meaning / purpose of large words.) Supposedly, "aposematic coloring" is a conspicuous coloring like red, orange, or yellow that warns predators to stay away.

The presentation mentioned a few insects and butterflies that have aposematic coloring, like the bumblebee and the monarch butterfly. It then mentioned that some creatures learn to stay away from these colorful creatures, and then closed with a vague comment about evolution.

The presentation was seriously flawed, not by any particular sentence, but by the implications suggested by what was NOT spoken. For example:

- 1) Many bugs have red, orange, or yellow coloring and are NOT poisonous.
- 2) Many bugs are coal black, difficult to see, and ARE poisonous.
- 3) Many other animals also have brilliant colors - supposedly to attract the opposite gender.
- 4) This variance of color is actually a brilliant example of the diversity of God's creation!
- 5) Evolution does NOT include learned traits. (If it did, we wouldn't be home schooling our children!)
- 6) And lastly, many of these fears (protection mechanisms) were NOT learned!

For example, in my bantam weight championship battle of the yellow-jacket and the spider, both creatures knew to stay away from the other! (By the way, one was yellow and one was black.) But even more incredible; both creatures knew which end of the opponent to avoid!!! This is absolutely incredible since neither creature could have possibly "learned" this information! One bite of the spider or one sting of the yellow-jacket would be deadly for the recipient. This is not a lesson either creature would ever be given the opportunity to learn. They knew this information because God programmed it into their existence right along with the rest of their bodily needs!

Do you see the need to develop a keen ear for truth? So back to my original question; "Are You Studying Science From A Biblical Perspective?" If not, when will you start?
